Did You Know?

- Many reputable insurance companies offer discounts to homeowners with ‘whole-house’ surge protection systems.

- Brief, high voltage surges known as transients occur every time the flow of electricity is disturbed. These surges have been known to occur at rates as high as 6000 events per hour in a typical home.

There are two types of surges:

- External - Lightning strikes and utility company surges. These account for only about 20% of all surges.

- Internal - Any time the flow of electricity is altered, a surge can occur. The simple act of turning on or off any motor, piece of electronic equipment, or any other electric device can create surges. In general the larger the load the greater the disturbance. Internal surges account for greater than 80% of all surges.

In today’s digital age, it is more important than ever to protect your home and office from damaging surges that can corrupt and destroy your valuable electronics and equipment. Electronic equipment is being manufactured smaller and lighter. This compact design has made our lives more convenient, but has sacrificed survivability and durability. A compact design, combined with the ‘digital switching’ nature of today’s electrical systems, is the perfect environment for surges to exist unchecked – constantly damaging equipment inside your home. These surges are consistently bombarding our electrical systems with brief, cumulatively damaging surges. As our equipment endures these surges, it slowly degrades the components eventually rendering the equipment inoperable. This type of damage and expense can be avoided with a proper surge suppression system. It is critical to cover all of the possible paths that damaging surges can take to enter your house. This would include AC Power, phone lines, and coaxial cable lines as well. If all paths are not protected, surges will be directed to the path of least resistance rather than mitigating them with a properly designed surge protection system.

Protect your valuables from the constant threat of ever-present surges with a surge suppression system designed by Surge Suppression Incorporated, the best in the business!
PROTECT YOUR INVESTMENT WITH TOTAL HOME/OFFICE PROTECTION

TOTAL PACKAGE PROTECTION FOR YOUR HOME AND OFFICE

PHONE UNIT

- This telephone line device is designed to protect standard voice grade telephone lines.
- Covers up to 4 lines
- The Unique design of these devices makes them among the most versatile SPD devices on the market with superior performance specs and a warranty that is second to none.

AC UNIT

- The RESS Device provides the absolute best surge protection available for AC residential or light commercial panels. It is extremely effective in virtually eliminating internally generated transients and is an absolute must on panels feeding high tech homes or small offices.
- UL 3rd Edition Listed

COAXIAL UNIT

- The coaxial devices are connected in series using common BNC, F, N or UHF coaxial connectors, making your installation a breeze.
- Devices cover both cable and satellite installations.
